Its floors, ceilings, walls, and doors should be free of cracks and leaks. It should have a brick foundation with no.0.3...

6. METHODS Wet Roots The main element in this comparison study was the use of deep roots, using a local short-term arid-relief plot that had no irrigation. the use of septic systems and the use of the sawdust for mulching. In this plot, trees were planted in holes that were between two and five feet deep, according to what one would expect to be the depth at which roots might grow. Trees were planted at 5,10, 15 and 20 feet in the soil surface. Sawdust was spread over the soil and was then compacted. Fire clay was spread over the sawdust and then leveled and raked. Some of the sites were given a thin layer of loose sawdust. From the tests of the climatic data, the contour plot of water potential ( $\hat{A}\cdot\pi p$ ) showed a pattern that was representative of the distribution of precipitation in the region. The mean water potential and the evapotranspiration were also measured in the plots in each year. To determine the distribution of roots in the plots, the soil was excavated and roots were removed from the ground. The depth of the roots was determined by weighing the roots and planting time. It was found that in the dry plots, with no irrigation, the water potential under the sawdust did not exceed 0.6. The distribution of the depth of the roots was mostly in the 1 to 3 inches range. Fig. 8, Potentially deep roots can be used to prevent freeze-and -thaw. (A) The frost barrier is made of two pipes that are glued together to form a circle. In the center of the circle is a hole. (B) This combination of the pipes and the hole works well when the ground freezes and thaws twice. (C) When used in the summer, the frost barrier retains heat and water. (D) In the winter, the frost barrier can be used as a frost shield when there is no irrigation. Mould when the ground thaws.

6 Deep Roots When the ground thaws, it was found that those root systems were damaged and they had to be replanted into the sawdust. This occurred in all of the plots. However, the bottom of the soil was not damaged. A one or two percent frost damage was also recorded. It was found that the depth of these roots decreased in both the wet and dry years when tested. It was also found that the water potential increased in the sawdust. The 0cc13bf012
