Rang De Basanti Movie Full Version 720p818 F.2d 861 Unpublished Disposition NOTICE: Sixth Circuit Rule 24(c) states that citation of unpublished dispositions is disfavored except for establishing res judicata, estoppel, or the law of the case and requires service of copies of cited unpublished dispositions of the Sixth Circuit. Ronald C. ROWE, Plaintiff-Appellant, v. SECRETARY OF HEALTH AND HUMAN SERVICES, Defendant-Appellee. No. 86-6034. United States Court of Appeals, Sixth Circuit. April 30, 1987. Before WELLFORD and GUY, Circuit Judges, and LIVELY, Senior Circuit Judge. PER CURIAM. 1 Ronald Rowe sought judicial review of a decision denying his disability claim. On a cold record, claimant filed a summary judgment motion and supporting brief. The Secretary denied the motion and claimant now appeals that decision. The Secretary's brief failed to comply with the Federal Rules of Appellate Procedure, however. We conclude the notice of appeal was timely filed and therefore consider the merits of the appeal. Appellee's violations of the Federal Rules of Appellate Procedure can not be excused on a technicality. We conclude the notice of appeal was filed timely and the District Court erred in dismissing the appeal. 2 Claimant applied for disability benefits on January 24, 1981, and his application was denied in 1983 after a hearing. The Appeals Council, based on a report by the Disability Determination Bureau, denied review on November 14, 1984. Plaintiff then filed a complaint in the 1cdb36666d

ServerÂ .There are some desirable techniques for constructing a timber frame, some of them having
been described on occasion. However, a unique combination of desirable techniques in a novel and
economically efficient manner has not been devised. This is true for a commercial construction
process and to that end the present invention constitutes new and useful advances in this area. One
method that has been developed for timber framing is a mechanical process known as the knock
down. Here a framework is fabricated, generally consisting of two elements, a header and a truss.

The header and truss are connected to one another by means of a pin-type connector called a lap
connector. A sheet of plywood is inserted between the header and truss, its edges lying flush with or
being fastened to the truss and header. The plywood faces between the trusses and headers and the
lap connector is driven into the trusses and headers, and then the plywood is held in place by
tightening nuts on the lap connector, which are tightened against the ends of the truss and header.

The result is a finished timber framed building. Several methods of accomplishing this have evolved,
the most common being the use of sliding lap connectors, rather than pins, that are friction fit
between the truss and header. In this process a pair of mating lap connectors, with corresponding
recesses in their outer faces, are produced from two sheets of plywood, the lap connectors being
fastened, on one of the plywood sheets, to be flat against the sheet and to be recessed a distance
equal to the thickness of the plywood sheet. These lap connectors are disposed in the appropriate
positions in the truss and header prior to assembling the two elements of the framework. The other
plywood
